

ENTERPRISE ARCHITECTURE · OPERATING MODEL

Five clock speeds. *One continuous practice.*

A multi-cadence agent mesh for continuous EA governance — Daily, Weekly, Monthly, Quarterly
Monthly, Quarterly and Yearly loops running the twelve core artefacts of the practice.

12 ARTEFACTS

13 AGENTS

5 CADENCES

8 STAKEHOLDER GROUPS

EA governance runs on committee time. Technology change doesn't.

Traditional EA

- Point-in-time landscape audits, stale within weeks
- Quarterly or annual blueprint refresh
- Governance gates enforced manually, inconsistently
- Portfolio and roadmap reviews reactive, not continuous
- Provenance lives in someone's memory, not a log

Agentic EA Mesh

- Continuous telemetry — landscape reflects reality daily
- Annual blueprint synthesised from a full year of real signal
- Policy-as-code gates applied identically, every time
- Portfolio rebalancing (TIME) runs monthly as a standing cycle
- Every decision cites its data source and policy version

Not five silos. One mesh with five clock speeds.

Faster loops generate signal upward. Slower loops set constraints back down.

Signal flows up · Constraints flow down

Sense, review, adjust, realign, reset

Thirteen agents, one orchestrator

Orchestrator Agent

Sequences the five loops, routes outputs to the right stakeholder, manages escalation between cadences.

Health Agent

Asset telemetry — EOL, vulnerability, performance.

Gate Agent

Policy-as-code enforcement; exception register.

Landscape Agent

Infra/integration discovery; drift detection.

Assessment Agent

Structured, scored design reviews.

Portfolio Agent

TIME analysis — Tolerate/Invest/Migrate/Eliminate.

Roadmap Agent

Re-baselines roadmaps against real progress.

Pattern Agent

Mines and retires reusable patterns.

Capability Agent

Capability heat-mapping vs. strategic priority.

Principles Agent

Flags principle drift; drives refresh.

Transformation Agent

Tracks multi-quarter programmes and benefits.

Blueprint Agent

Annual synthesis into the EA blueprint.

Narrative Agent

Drafts white papers from the year's data.

Every role meets the mesh at its own cadence

Solution Architects	DAILY / WEEKLY	Chat interface into Gate & Assessment Agents — cited policy and pattern reference on demand.
Engineering Managers	DAILY / WEEKLY	Health and drift digests; escalation alerts on critical asset degradation.
Product Owners	MONTHLY	Portfolio/roadmap pack — approve TIME recommendations, not just view them.
Heads Of	MONTHLY / QUARTERLY	Portfolio health and capability heat-map for investment sign-off.
General Managers	QUARTERLY	Board pack and risk committee view — agent-prepared, human-approved.
CxO Stakeholders	QUARTERLY / YEARLY	Blueprint, white papers, transformation options with pros/cons and provenance.
External Consultants	ON-DEMAND	Scoped read access to the governance register — full audit trail, no write access.
Auditors	ON-DEMAND	Immutable log of every gate decision and override, with rationale attached.

The mesh trades committee latency for machine speed

REWARD

- **Continuous coverage**

Landscape and health state reflect reality daily, not at the last audit.

- **Consistent governance**

The same principles are applied identically to every design, every time.

- **Full provenance**

Every decision cites its data source, policy version and prior precedent.

- **Faster cycle time**

Design reviews and gate checks move from board-cycle to same-day.

RISK

- **Automation complacency**

Auto-approvals can be rubber-stamped rather than genuinely assessed.

- **Principle ossification**

Rules keep being enforced after they've stopped fitting the business.

- **Alert fatigue**

Continuous telemetry can overwhelm humans without tuned thresholds per asset tier.

- **False confidence**

Agents optimise for what's measurable and can miss strategic or political nuance.

Build the mesh bottom-up — start with the fastest loop

A yearly Blueprint Agent with no daily telemetry underneath it is just a faster PowerPoint generator. The value is in the mesh.

Where the value shows up — and how to measure it

Directional value categories — quantify against your own portfolio baseline before committing to a business case.

Governance cycle time Design review and exception handling move from board-cycle (weeks) to same-day gate response. Measure: median time from design submission to governance governance decision.	Landscape currency Technology landscape maps reflect discovered state weekly instead of at the last audit. Measure: age of landscape data at time of decision-making.	Portfolio discipline TIME (Tolerate/Invest/Migrate/Eliminate) decisions run as a standing monthly cycle, not an annual scramble. Measure: % of portfolio with a current TIME classification.
Audit readiness Every governance decision carries provenance — source, policy version, precedent — by default. Measure: time-to-evidence when an auditor requests a decision trail.	Strategic coherence The annual blueprint is grounded in a full year of continuous signal, not a workshop snapshot. Measure: variance between blueprint assumptions and realised portfolio outcomes.	Capacity redirection Architects and PO time shifts from manual review/reporting toward higher-value design and strategy work. Measure: hours per month spent on manual governance reporting, before vs. after.

NEXT STEPS

Start with one loop. Prove the signal. Build the mesh.

- 1 Stand up the Health and Gate Agents against one critical asset domain
- 2 Instrument policy-as-code for the top 5 recurring governance exceptions
- 3 Run one Monthly portfolio TIME cycle end-to-end with Product Owners
- 4 Bring the first agent-prepared pack to the Architecture Board for critique
